4 Port RJ45 Modem Splitter

Part # 5000833

The RJ45 Modem Splitter is designed to permit multiple terminals to share a single modem. This passive device is non-powered and transparent to data formats and speeds. Data received from the modem is transmitted to all attached terminal devices. Only one terminal device may send data to the modem at a time. The MASTER port is intended to be connected to a DCE device such as a modem using an RJ45 straight thru cable and the appropriate RJ/DB adapter. All other ports (Port 1 through Port 4) are to be connected to DTE terminal devices.

There are no user configurable settings in the RJ45 Modem Splitter. Simply connect the modem and terminal devices to RJ45 Modem Splitter and then power up your modem and terminals as normal.
